

EDITORIAL

With pleasure we present in this second issue of the year 2021, various scientific articles by researchers who work on potato cultivation in different Latin American countries.

This volume presents research results that are related to the analysis of native potatoes and their impact at the level of consumption and market innovation, it analyzes the factors that undermine the sustainability of the homes of potato producers in Colombia. Likewise, the current situation of industrial potatoes in Ecuador is analyzed. Finally, an investigation about potato fertilization is shared, where the use of phosphorus efficiency to improve yield and quality is analyzed.

For the Latin American Potato Journal, it is a pleasure to receive and edit all the articles that we receive, so that they can be disseminated in the countries, the region and the world. So, the processes have improved substantially, and currently all of these are carried out online.

Therefore, we invite all researchers to send their scientific contributions to our journal, to be considered for possible publication. On our part, we guarantee their transparency and excellence during the editing process and in the publication itself. It is important that we consider motivating them to carry out this important task such as publishing, since as researchers we are important actors in the process of productive and economic reactivation of the post-COVID-19 pandemic region. We consider that our journal is an important means to publish our results, in such a way that they are visible to academia, researchers and producers of potato cultivation in Latin America and the world.

For the Latin American Potato Association (LAPA) it is a source of satisfaction to communicate the scientific advances of our researchers and we reiterate the call to contribute with their articles.
